

SPECIFICATION

[0142] Referring to FIGS. 37 and 38, the first retaining device 310 and the second retaining device 312 are spring loaded retention clips, wherein the first retaining device 310 is a handle clip mounted on grip 314 and the second retaining device 312 is a slide clip mounted on slide member 320. The handle clip 310 includes a thumb plate 332 for laterally opening and closing the handle clip 310, wherein when the thumb plate 332 is depressed the handle clip 310 is laterally opened and when the thumb plate 332 is released the handle clip 310 is closed by spring action. Additionally, the thumb plate 332 is of sufficient length (with respect to the guide wire) to engage the slide clip 312 throughout the range of motion of the sliding member 320, such that when the thumb plate 332 is depressed, the slide clip 312 is laterally opened and when the thumb plate 332 is released the slide clip 312 is laterally closed. The handle clip 310 and slide clip 312 each include an alignment indicator 334 for positioning the actuation sleeve 44. The alignment indication 334 includes a channel 336, longitudinally traversing the clips 310, 312, configured for receiving the actuator sleeve 44. (See also FIG. 39).
